

Explorations in Ruby: Practicals

Week 7: Practical 7

- 1) Get 5 regular emails and 5 advance-fee fraud emails (aka spam). Save them as text and change them so they are a single, long string. Then turn each into an array of words (**split** may help here). Then use a bunch of regular expressions to search the array of words looking for keywords to classify which files are spam or not. If you want to get fancy you could give each array a spam-score out of 10.
- 2) Do some scraping using Nokogiri on an arbitrarily selected web page from somewhere.
- 3) Define your own class that illustrates the differences between public, private and protected methods. It should not be anything like the ones I did. Make sure that the methods you write do something more interesting than print out stuff.
