

Fourth Edition

BIG JAVA

CAY S. HORSTMANN

International Student Version

Chapter 13 – Sorting and Searching

Chapter Goals

- To study several sorting and searching algorithms
- To appreciate that algorithms for the same task can differ widely in performance
- To understand the big-Oh notation
- To learn how to estimate and compare the performance of algorithms
- To learn how to measure the running time of a program

Selection Sort

- Sorts an array by repeatedly finding the smallest element of the unsorted tail region and moving it to the front
- Slow when run on large data sets
- Example: sorting an array of integers

11	9	17	5	12
----	---	----	---	----

Sorting an Array of Integers

- Find the smallest and swap it with the first element

5	9	17	11	12
---	---	----	----	----

- Find the next smallest. It is already in the correct place

5	9	17	11	12
---	---	----	----	----

- Find the next smallest and swap it with first element of unsorted portion

5	9	11	17	12
---	---	----	----	----

- Repeat

5	9	11	12	17
---	---	----	----	----

- When the unsorted portion is of length 1, we are done

5	9	11	12	17
---	---	----	----	----

ch13/selsort/SelectionSorter.java

```
1  /**
2   * This class sorts an array, using the selection sort
3   * algorithm
4   */
5  public class SelectionSorter
6  {
7      private int[] a;
8
9      /**
10       * Constructs a selection sorter.
11       * @param anArray the array to sort
12       */
13     public SelectionSorter(int[] anArray)
14     {
15         a = anArray;
16     }
17 }
```

45     Swaps two entries of the array.
46     @param i the first position to swap
47     @param j the second position to swap
48  */
49  private void swap(int i, int j)
50  {
51      int temp = a[i];
52      a[i] = a[j];
53      a[j] = temp;
54  }
55 }
```

ch13/selsort/SelectionSortDemo.java

```
1  import java.util.Arrays;
2
3  /**
4   * This program demonstrates the selection sort algorithm by
5   * sorting an array that is filled with random numbers.
6   */
7  public class SelectionSortDemo
8  {
9      public static void main(String[] args)
10     {
11         int[] a = ArrayUtil.randomIntArray(20, 100);
12         System.out.println(Arrays.toString(a));
13
14         SelectionSorter sorter = new SelectionSorter(a);
15         sorter.sort();
16
17         System.out.println(Arrays.toString(a));
18     }
19 }
20
21
```

ch13/selsort/ArrayUtil.java

```
1  import java.util.Random;
2
3  /**
4   * This class contains utility methods for array manipulation.
5   */
6  public class ArrayUtil
7  {
8      private static Random generator = new Random();
9
10     /**
11      * Creates an array filled with random values.
12      * @param length the length of the array
13      * @param n the number of possible random values
14      * @return an array filled with length numbers between
15      *         0 and n - 1
16      */
17     public static int[] randomIntArray(int length, int n)
18     {
19         int[] a = new int[length];
20         for (int i = 0; i < a.length; i++)
21             a[i] = generator.nextInt(n);
22
23         return a;
24     }
25 }
```

ch13/selsort/ArrayUtil.java (cont.)

Typical Program Run:

```
[65, 46, 14, 52, 38, 2, 96, 39, 14, 33, 13, 4, 24, 99, 89, 77, 73, 87, 36, 81]  
[2, 4, 13, 14, 14, 24, 33, 36, 38, 39, 46, 52, 65, 73, 77, 81, 87, 89, 96, 99]
```

Self Check 13.1

Why do we need the `temp` variable in the `swap` method? What would happen if you simply assigned `a[i]` to `a[j]` and `a[j]` to `a[i]`?

Answer: Dropping the `temp` variable would not work. Then `a[i]` and `a[j]` would end up being the same value.

Self Check 13.2

What steps does the selection sort algorithm go through to sort the sequence 6 5 4 3 2 1?

Answer:

1	5	4	3	2	6
---	---	---	---	---	---

1	2	4	3	5	6
---	---	---	---	---	---

1	2	3	4	5	6
---	---	---	---	---	---

Profiling the Selection Sort Algorithm

- We want to measure the time the algorithm takes to execute
 - *Exclude the time the program takes to load*
 - *Exclude output time*
- Create a `StopWatch` class to measure execution time of an algorithm
 - *It can start, stop and give elapsed time*
 - *Use `System.currentTimeMillis` method*
- Create a `StopWatch` object
 - *Start the stopwatch just before the sort*
 - *Stop the stopwatch just after the sort*
 - *Read the elapsed time*

ch13/selsort/StopWatch.java

```
1  /**
2      A stopwatch accumulates time when it is running. You can
3      repeatedly start and stop the stopwatch. You can use a
4      stopwatch to measure the running time of a program.
5  */
6  public class Stopwatch
7  {
8      private long elapsedTime;
9      private long startTime;
10     private boolean isRunning;
11
12     /**
13         Constructs a stopwatch that is in the stopped state
14         and has no time accumulated.
15     */
16     public Stopwatch()
17     {
18         reset();
19     }
20
```

Continued

ch13/selsort/StopWatch.java (cont.)

```
21    /**
22     * Starts the stopwatch. Time starts accumulating now.
23     */
24    public void start()
25    {
26        if (isRunning) return;
27        isRunning = true;
28        startTime = System.currentTimeMillis();
29    }
30
31    /**
32     * Stops the stopwatch. Time stops accumulating and is
33     * is added to the elapsed time.
34     */
35    public void stop()
36    {
37        if (!isRunning) return;
38        isRunning = false;
39        long endTime = System.currentTimeMillis();
40        elapsedTime = elapsedTime + endTime - startTime;
41    }
42
```

ch13/selsort/SelectionSortTimer.java (cont.)

```
21         // Use stopwatch to time selection sort
22
23         Stopwatch timer = new Stopwatch();
24
25         timer.start();
26         sorter.sort();
27         timer.stop();
28
29         System.out.println("Elapsed time: "
30             + timer.getElapsedTime() + " milliseconds");
31     }
32 }
33
34
```

Program Run:

```
Enter array size: 100000
Elapsed time: 27880 milliseconds
```

Selection Sort on Various Size Arrays*

n	Milliseconds
10,000	786
20,000	2,148
30,000	4,796
40,000	9,192
50,000	13,321
60,000	19,299

* Obtained with a Pentium processor, 2 GHz, Java 6, Linux

Selection Sort on Various Size Arrays

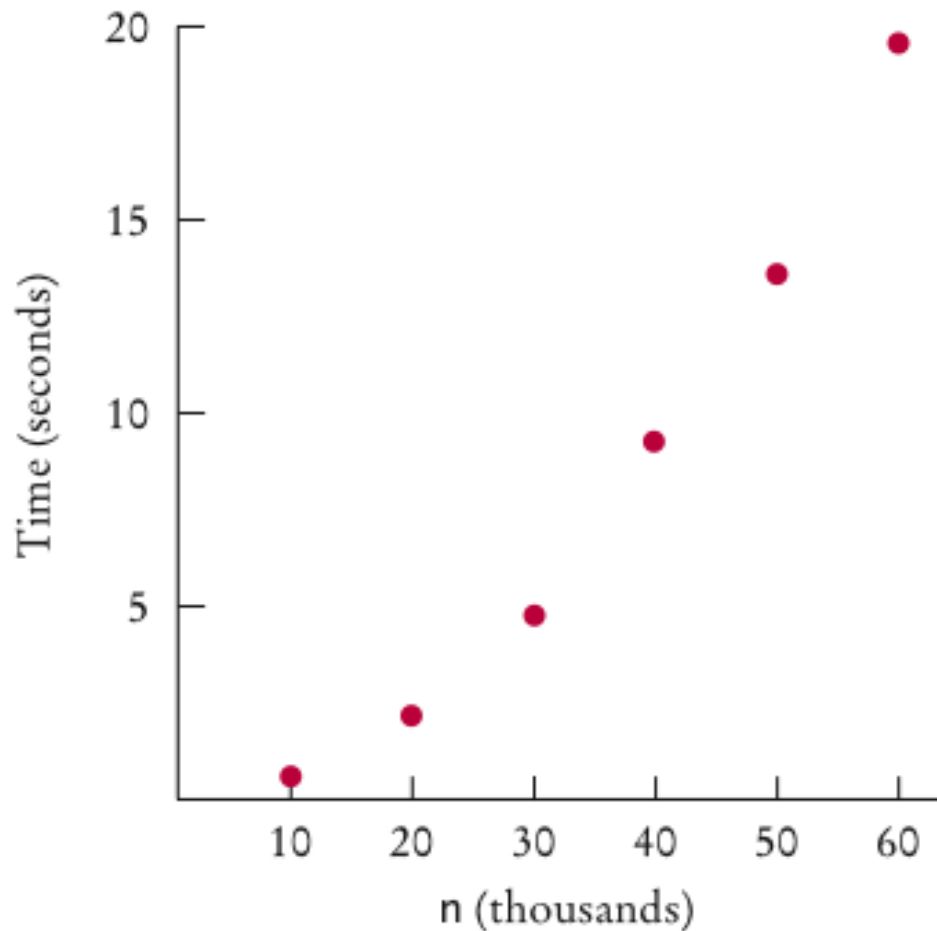

Figure 1 Time Taken by Selection Sort

Selection Sort on Various Size Arrays

- Doubling the size of the array more than doubles the time needed to sort it

Self Check 13.3

Approximately how many seconds would it take to sort a data set of 80,000 values?

Answer: Four times as long as 40,000 values, or about 36 seconds.

Self Check 13.4

Look at the graph in Figure 1. What mathematical shape does it resemble?

Answer: A parabola.

Analyzing the Performance of the Selection Sort Algorithm

- In an array of size n , count how many times an array element is visited
 - *To find the smallest, visit n elements + 2 visits for the swap*
 - *To find the next smallest, visit $(n - 1)$ elements + 2 visits for the swap*
 - *The last term is 2 elements visited to find the smallest + 2 visits for the swap*

Analyzing the Performance of the Selection Sort Algorithm

- The number of visits:
 - $n + 2 + (n - 1) + 2 + (n - 2) + 2 + \dots + 2 + 2$
 - *This can be simplified to $n^2 / 2 + 5n / 2 - 3$*
 - *$5n / 2 - 3$ is small compared to $n^2 / 2$ — so let's ignore it*
 - *Also ignore the $1 / 2$ — it cancels out when comparing ratios*

Analyzing the Performance of the Selection Sort Algorithm

- The number of visits is of the order n^2
- Using big-Oh notation: The number of visits is $O(n^2)$
- Multiplying the number of elements in an array by **2** multiplies the processing time by **4**
- Big-Oh notation “ $f(n) = O(g(n))$ ” expresses that f grows no faster than g
- To convert to big-Oh notation: Locate fastest-growing term, and ignore constant coefficient

Self Check 13.5

If you increase the size of a data set tenfold, how much longer does it take to sort it with the selection sort algorithm?

Answer: It takes about 100 times longer.

Self Check 13.6

How large does n need to be so that $n^2/2$ is bigger than $5n/2 - 3$?

Answer: If n is 4, then $n^2/2$ is 8 and $5n/2 - 3$ is 7.

Insertion Sort

- Assume initial sequence $a[0] \dots a[k]$ is sorted ($k = 0$):

11	9	16	5	7
----	---	----	---	---

- Add $a[1]$; element needs to be inserted before 11

9	11	16	5	7
---	----	----	---	---

- Add $a[2]$

9	11	16	5	7
---	----	----	---	---

- Add $a[3]$

5	9	11	16	7
---	---	----	----	---

- Finally, add $a[4]$

5	9	11	16	7
---	---	----	----	---

ch13/insertionsort/InsertionSorter.java

```
1  /**
2     This class sorts an array, using the insertion sort
3     algorithm
4  */
5  public class InsertionSorter
6  {
7      private int[] a;
8
9      /**
10         Constructs an insertion sorter.
11         @param anArray the array to sort
12     */
13     public InsertionSorter(int[] anArray)
14     {
15         a = anArray;
16     }
17 }
```

Continued

ch13/insertionsort/InsertionSorter.java (cont.)

```
18  /**
19      Sorts the array managed by this insertion sorter
20  */
21  public void sort()
22  {
23      for (int i = 1; i < a.length; i++)
24      {
25          int next = a[i];
26          // Move all larger elements up
27          int j = i;
28          while (j > 0 && a[j - 1] > next)
29          {
30              a[j] = a[j - 1];
31              j--;
32          }
33          // Insert the element
34          a[j] = next;
35      }
36  }
37  }
```

Merge Sort

- Sorts an array by
 - *Cutting the array in half*
 - *Recursively sorting each half*
 - *Merging the sorted halves*
- Dramatically faster than the selection sort

Merge Sort Example

- Divide an array in half and sort each half

5	9	10	12	17	1	8	11	20	32
---	---	----	----	----	---	---	----	----	----

- Merge the two sorted arrays into a single sorted array

5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32
5	9	10	12	17	1	8	11	20	32

1									
1	5								
1	5	8							
1	5	8	9						
1	5	8	9	10					
1	5	8	9	10	11				
1	5	8	9	10	11	12			
1	5	8	9	10	11	12	17		
1	5	8	9	10	11	12	17	20	
1	5	8	9	10	11	12	17	20	32

Merge Sort

```
public void sort()
{
    if (a.length <= 1) return;
    int [] first = new int[a.length / 2];
    int[] second = new int[a.length - first.length];
    // Copy the first half of a into first, the second half
    // into second
    . . .
    MergeSorter firstSorter = new MergeSorter(first);
    MergeSorter secondSorter = new MergeSorter(second);
    firstSorter.sort();
    secondSorter.sort();
    merge(first, second);
}
```

ch13/mergesort/MergeSorter.java

```
1  /**
2     This class sorts an array, using the merge sort algorithm.
3  */
4  public class MergeSorter
5  {
6     private int[] a;
7
8     /**
9         Constructs a merge sorter.
10        @param anArray the array to sort
11    */
12    public MergeSorter(int[] anArray)
13    {

ch13/mergesort/MergeSortDemo.java (cont.)

Typical Program Run:

```
[8, 81, 48, 53, 46, 70, 98, 42, 27, 76, 33, 24, 2, 76, 62, 89, 90, 5, 13, 21]  
[2, 5, 8, 13, 21, 24, 27, 33, 42, 46, 48, 53, 62, 70, 76, 76, 81, 89, 90, 98]
```

Self Check 13.7

Why does only one of the two `while` loops at the end of the `merge` method do any work?

Answer: When the preceding `while` loop ends, the loop condition must be `false`, that is,

`iFirst >= first.length or iSecond >= second.length`
(De Morgan's Law).

Self Check 13.8

Manually run the merge sort algorithm on the array 8 7 6 5 4 3 2 1.

Answer:

First sort 8 7 6 5.

Recursively, first sort 8 7.

Recursively, first sort 8. It's sorted.

Sort 7. It's sorted.

Merge them: 7 8.

Do the same with 6 5 to get 5 6.

Merge them to 5 6 7 8.

Do the same with 4 3 2 1: Sort 4 3 by sorting 4 and 3 and merging them to 3 4.

Sort 2 1 by sorting 2 and 1 and merging them to 1 2.

Merge 3 4 and 1 2 to 1 2 3 4.

Finally, merge 5 6 7 8 and 1 2 3 4 to 1 2 3 4 5 6 7 8.

Analyzing the Merge Sort Algorithm

<i>n</i>	Merge Sort (milliseconds)	Selection Sort (milliseconds)
10,000	40	786
20,000	73	2,148
30,000	134	4,796
40,000	170	9,192
50,000	192	13,321
60,000	205	19,299

Merge Sort Timing vs. Selection Sort

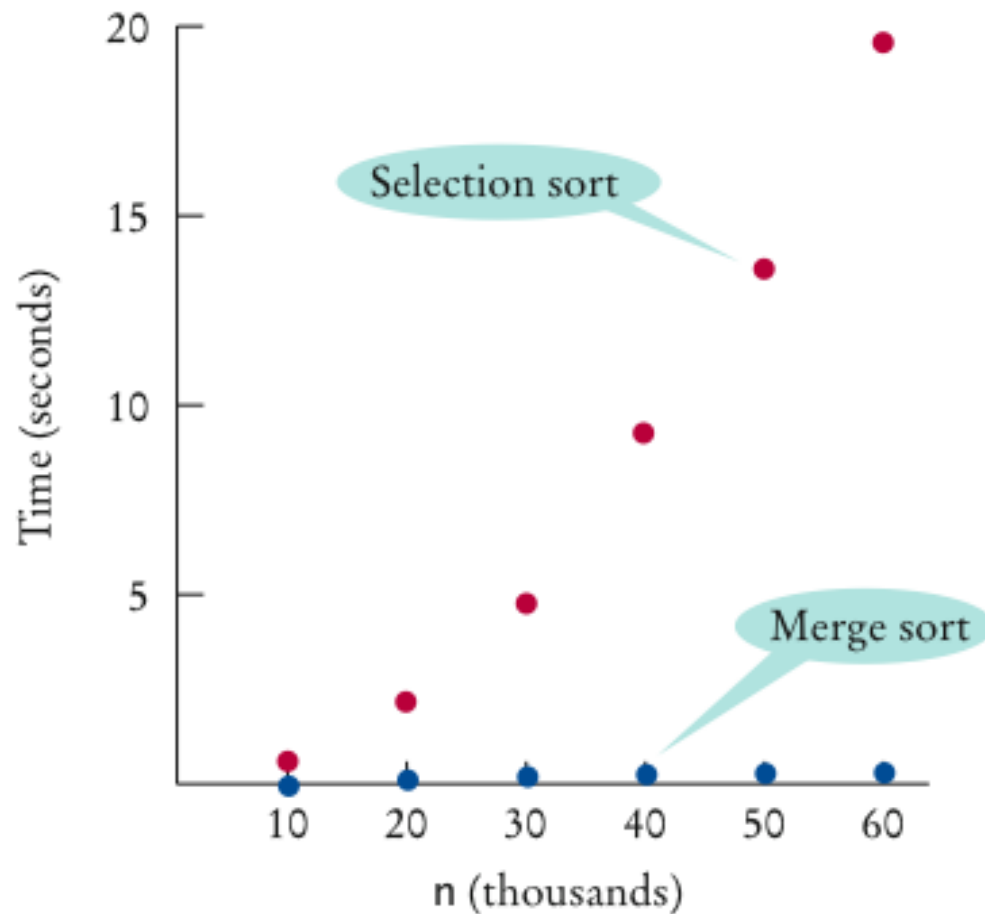

Figure 2
Merge Sort Timing versus Selection Sort

Analyzing the Merge Sort Algorithm

- In an array of size n , count how many times an array element is visited
- Assume n is a power of 2: $n = 2^m$
- Calculate the number of visits to create the two sub-arrays and then merge the two sorted arrays
 - *3 visits to merge each element or $3n$ visits*
 - *$2n$ visits to create the two sub-arrays*
 - *total of $5n$ visits*

Analyzing the Merge Sort Algorithm

- Let $T(n)$ denote the number of visits to sort an array of n elements then
 - $T(n) = T(n/2) + T(n/2) + 5n$ or
 - $T(n) = 2T(n/2) + 5n$
- The visits for an array of size $n/2$ is:
 - $T(n/2) = 2T(n/4) + 5n/2$
 - So $T(n) = 2 \times 2T(n/4) + 5n + 5n$
- The visits for an array of size $n/4$ is:
 - $T(n/4) = 2T(n/8) + 5n/4$
 - So $T(n) = 2 \times 2 \times 2T(n/8) + 5n + 5n + 5n$

Analyzing Merge Sort Algorithm

- Repeating the process k times:
 - $T(n) = 2^k T(n/2^k) + 5nk$
 - Since $n = 2^m$, when $k=m$: $T(n) = 2^m T(n/2^m) + 5nm$
 - $T(n) = nT(1) + 5nm$
 - $T(n) = n + 5n\log_2(n)$

Analyzing Merge Sort Algorithm

- To establish growth order
 - *Drop the lower-order term n*
 - *Drop the constant factor 5*
 - *Drop the base of the logarithm since all logarithms are related by a constant factor*
 - *We are left with $n \log(n)$*
- Using big-Oh notation: Number of visits is $O(n \log(n))$

Merge Sort Vs Selection Sort

- Selection sort is an $O(n^2)$ algorithm
- Merge sort is an $O(n\log(n))$ algorithm
- The $n\log(n)$ function grows much more slowly than n^2

Self Check 13.9

Given the timing data for the merge sort algorithm in the table at the beginning of this section, how long would it take to sort an array of 100,000 values?

Answer: Approximately $100,000 \times \log(100,000) / 50,000 \times \log(50,000) = 2 \times 5 / 4.7 = 2.13$ times the time required for 50,000 values. That's 2.13×97 milliseconds or approximately 207 milliseconds.

Self Check 13.10

If you double the size of an array, how much longer will the merge sort algorithm take to sort the new array?

Answer: $(2n \log(2n)/n \log(n)) = 2(1 + \log(2)/\log(n))$. For $n > 2$, that is a value < 3 .

The Quicksort Algorithm

- Divide and conquer

1. Partition the range

2. Sort each partition

The Quicksort Algorithm

```
public void sort(int from, int to)
{
    if (from >= to)
        return;
    int p =
        partition(from, to);
    sort(from, p);
    sort(p + 1, to);
}
```

The Quicksort Algorithm

Partitioning a Range

Extending the Partitions

The Quicksort Algorithm

```
private int partition(int from, int to)
{
    int pivot = a[from];
    int i = from - 1;
    int j = to + 1;
    while (i < j)
    {
        i++;
        while (a[i] < pivot) i++;
        j--;
        while (a[j] > pivot) j--;
        if (i < j) swap(i, j);
    }
    return j;
}
```

The First Programmer

Babbage's Difference Engine

Searching

- **Linear search:** also called **sequential search**
- Examines all values in an array until it finds a match or reaches the end
- Number of visits for a linear search of an array of n elements:
 - *The average search visits $n/2$ elements*
 - *The maximum visits is n*
- A linear search locates a value in an array in $O(n)$ steps

ch13/linsearch/LinearSearcher.java

```
1  /**
2     A class for executing linear searches through an array.
3  */
4  public class LinearSearcher
5  {
6     private int[] a;
7
8     /**
9         Constructs the LinearSearcher.
10        @param anArray an array of integers
11    */
12    public LinearSearcher(int[] anArray)
13    {
14        a = anArray;
15    }
16
```

Continued

ch13/linsearch/LinearSearcher.java (cont.)

```
17  /**
18      Finds a value in an array, using the linear search
19      algorithm.
20      @param v the value to search
21      @return the index at which the value occurs, or -1
22      if it does not occur in the array
23  */
24  public int search(int v)
25  {
26      for (int i = 0; i < a.length; i++)
27      {
28          if (a[i] == v)
29              return i;
30      }
31      return -1;
32  }
33 }
```

ch13/linsearch/LinearSearchDemo.java

```
1  import java.util.Arrays;
2  import java.util.Scanner;
3
4  /**
5   * This program demonstrates the linear search algorithm.
6   */
7  public class LinearSearchDemo
8  {
9      public static void main(String[] args)
10     {
11         int[] a = ArrayUtil.randomIntArray(20, 100);
12         System.out.println(Arrays.toString(a));
13         LinearSearcher searcher = new LinearSearcher(a);
14
15         Scanner in = new Scanner(System.in);
16     }
```

Continued

ch13/linsearch/LinearSearchDemo.java (cont.)

```
17         boolean done = false;
18         while (!done)
19         {
20             System.out.print("Enter number to search for, -1 to quit:
21 ");
22             int n = in.nextInt();
23             if (n == -1)
24                 done = true;
25             else
26             {
27                 int pos = searcher.search(n);
28                 System.out.println("Found in position " + pos);
29             }
30         }
31     }
```

Typical Program Run:

```
[46, 99, 45, 57, 64, 95, 81, 69, 11, 97, 6, 85, 61, 88, 29, 65, 83, 88, 45, 88]
Enter number to search for, -1 to quit: 11
Found in position 8
```

Self Check 13.11

Suppose you need to look through 1,000,000 records to find a telephone number. How many records do you expect to search before finding the number?

Answer: On average, you'd make 500,000 comparisons.

Self Check 13.12

Why can't you use a "for each" loop `for (int element : a)` in the `search` method?

Answer: The `search` method returns the index at which the match occurs, not the data stored at that location.

Binary Search

- Locates a value in a sorted array by
 - *Determining whether the value occurs in the first or second half*
 - *Then repeating the search in one of the halves*

Binary Search

- To search 15:

[0][1][2][3][4][5][6][7]
1 5 8 9 12 17 20 32

[0][1][2][3][4][5][6][7]
1 5 8 9 12 17 20 32

[0][1][2][3][4][5][6][7]
1 5 8 9 12 17 20 32

[0][1][2][3][4][5][6][7]
1 5 8 9 12 17 20 32

- $15 \neq 17$: We don't have a match

ch13/binsearch/BinarySearcher.java

```
1  /**
2   * A class for executing binary searches through an array.
3   */
4  public class BinarySearcher
5  {
6      private int[] a;
7
8      /**
9       * Constructs a BinarySearcher.
10      * @param anArray a sorted array of integers
11      */
12     public BinarySearcher(int[] anArray)
13     {
14         a = anArray;
15     }
16 }
```

Continued

ch13/binsearch/BinarySearcher.java (cont.)

```
17  /**
18     Finds a value in a sorted array, using the binary
19     search algorithm.
20     @param v the value to search
21     @return the index at which the value occurs, or -1
22     if it does not occur in the array
23  */
24  public int search(int v)
25  {
26      int low = 0;
27      int high = a.length - 1;
28      while (low <= high)
29      {
30          int mid = (low + high) / 2;
31          int diff = a[mid] - v;
32
33          if (diff == 0) // a[mid] == v
34              return mid;
35          else if (diff < 0) // a[mid] < v
36              low = mid + 1;
37          else
38              high = mid - 1;
39      }
40      return -1;
41  }
42 }
```

Binary Search

- Count the number of visits to search a sorted array of size n
 - *We visit one element (the middle element) then search either the left or right subarray*
 - *Thus: $T(n) = T(n/2) + 1$*
- If n is $n/2$, then $T(n/2) = T(n/4) + 1$
- Substituting into the original equation: $T(n) = T(n/4) + 2$
- This generalizes to: $T(n) = T(n/2^k) + k$

Binary Search

- Assume n is a power of 2, $n = 2^m$
where $m = \log_2(n)$
- Then: $T(n) = 1 + \log_2(n)$
- Binary search is an $O(\log(n))$ algorithm

Searching a Sorted Array in a Program

- The `Arrays` class contains a static `binarySearch` method
- The method returns either
 - *The index of the element, if element is found*
 - *Or -k - 1 where k is the position before which the element should be inserted:*

```
int[] a = { 1, 4, 9 };  
int v = 7;  
int pos = Arrays.binarySearch(a, v);  
    // Returns -3; v should be inserted before  
    // position 2
```

Self Check 13.13

Suppose you need to look through a sorted array with 1,000,000 elements to find a value. Using the binary search algorithm, how many records do you expect to search before finding the value?

Answer: You would search about 20. (The binary log of 1,024 is 10.)

Self Check 13.14

Why is it useful that the `Arrays.binarySearch` method indicates the position where a missing element should be inserted?

Answer: Then you know where to insert it so that the array stays sorted, and you can keep using binary search.

Self Check 13.15

Why does `Arrays.binarySearch` return $-k - 1$ and not $-k$ to indicate that a value is not present and should be inserted before position k ?

Answer: Otherwise, you would not know whether a value is present when the method returns 0.

Sorting Real Data

- The `Arrays` class contains static `sort` methods
- To sort an array of integers:

```
int[] a = ... ;  
Arrays.sort(a);
```

- That `sort` method uses the Quicksort algorithm (see Special Topic 13.3)

Sorting Real Data

- `Arrays.sort` sorts objects of classes that implement `Comparable` interface:

```
public interface Comparable
{
    int compareTo(Object otherObject);
}
```

- The call `a.compareTo(b)` returns
 - *A negative number if `a` should come before `b`*
 - *0 if `a` and `b` are the same*
 - *A positive number otherwise*

Sorting Real Data

- Several classes in Java (e.g. `String` and `Date`) implement `Comparable`
- You can implement `Comparable` interface for your own classes:

```
public class Coin implements Comparable
{
    ...
    public int compareTo(Object otherObject)
    {
        Coin other = (Coin)otherObject;
        if (value < other.value) return -1;
        if (value == other.value) return 0;
        return 1;
    }
    ...
}
```

compareTo Method

- The implementation must define a total ordering relationship

- *Antisymmetric*

If $a.compareTo(b) \leq 0$, then $b.compareTo(a) \geq 0$

- *Reflexive*

$a.compareTo(a) = 0$

- *Transitive*

If $a.compareTo(b) \leq 0$ and $b.compareTo(c) \leq 0$, then $a.compareTo(c) \leq 0$

Sorting Real Data

- Once your class implements `Comparable`, simply use the `Arrays.sort` method:

```
Coin[] coins = new Coin[n];  
// Add coins  
...  
Arrays.sort(coins);
```

- If the objects are stored in an `ArrayList`, use

```
Collections.sort:  
ArrayList<Coin> coins = new ArrayList<Coin>();  
// Add coins  
...  
Collections.sort(coins);
```

- `Collections.sort` uses the merge sort algorithm

Self Check 13.16

Why can't the `Arrays.sort` method sort an array of `Rectangle` objects?

Answer: The `Rectangle` class does not implement the `Comparable` interface.

Self Check 13.17

What steps would you need to take to sort an array of `BankAccount` objects by increasing balance?

Answer: The `BankAccount` class needs to implement the `Comparable` interface. Its `compareTo` method must compare the bank balances.
